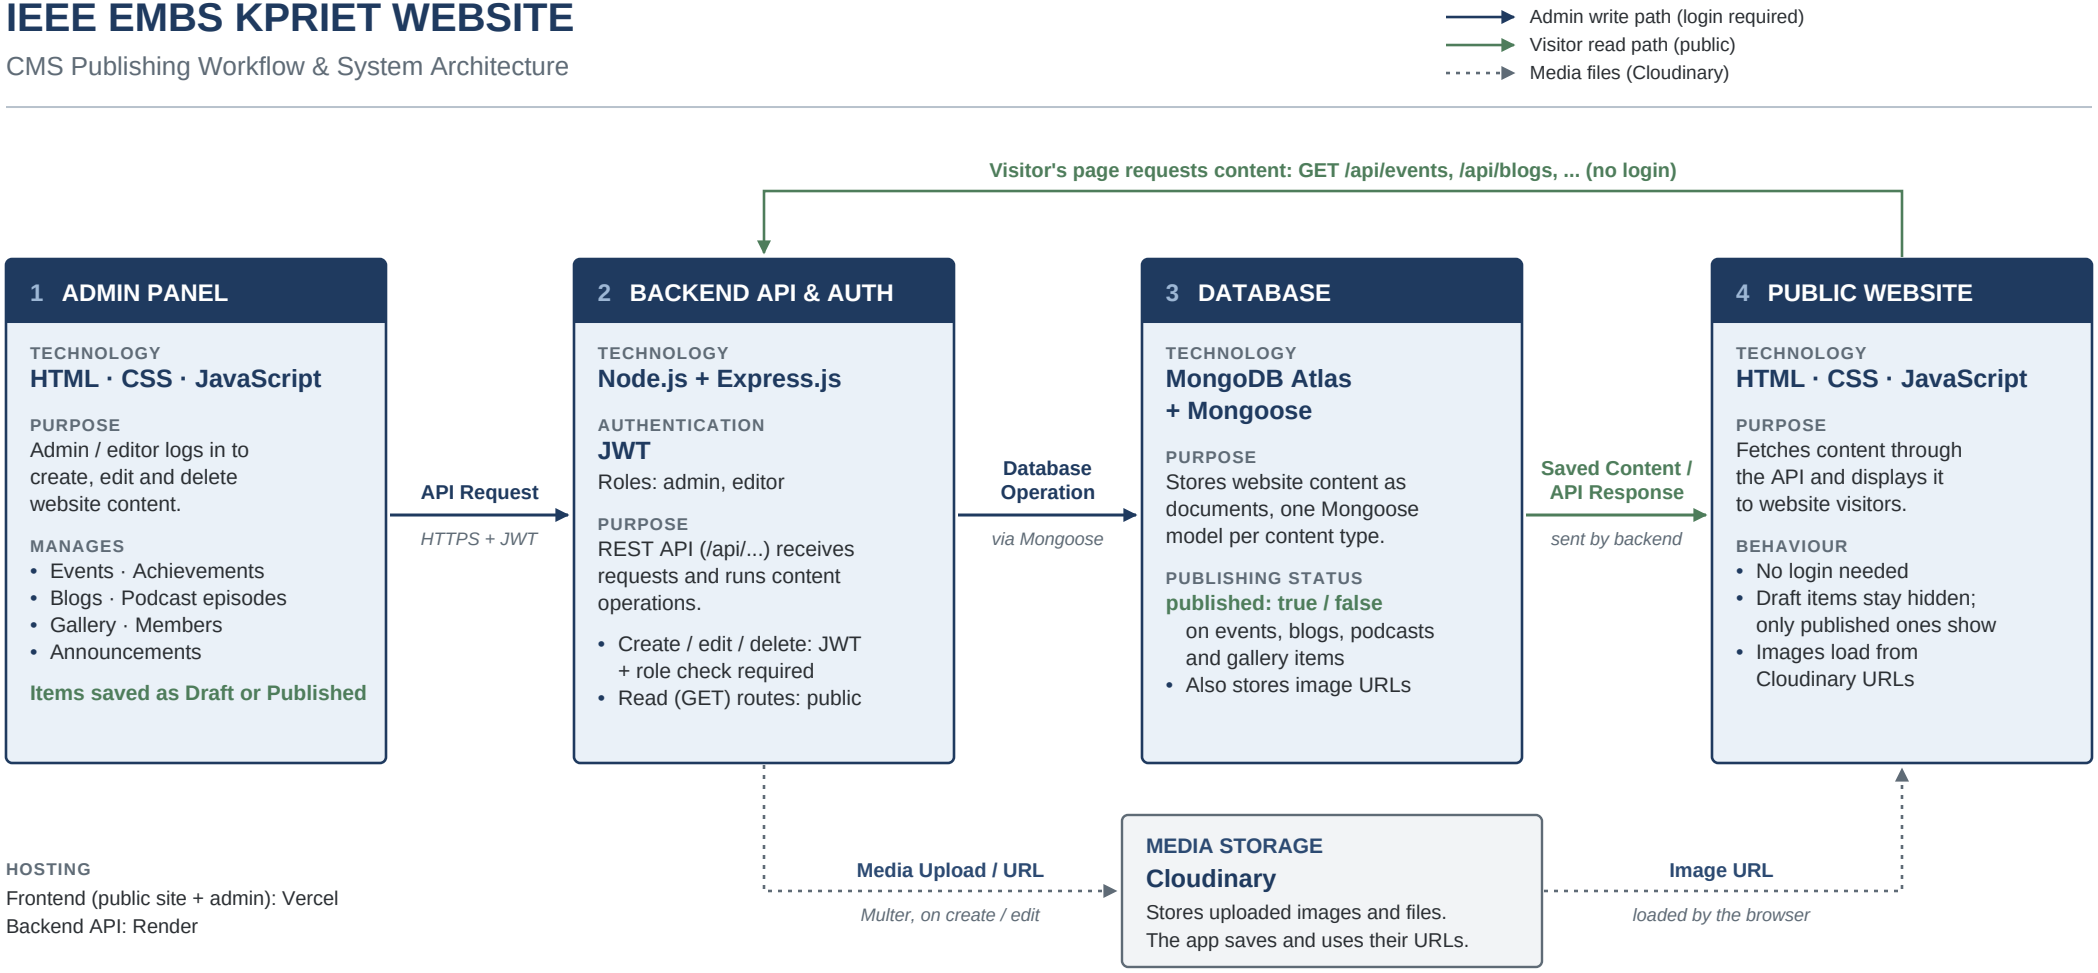
IEEE EMBS KPRIET WEBSITE

CMS Publishing Workflow & System Architecture



EXAMPLE: PUBLISHING A WEBSITE EVENT

1. Admin enters event details
Fills title, date, venue and thumbnail; chooses Draft or Published.

→

2. Backend API processes it
POST /api/events: JWT + role checked, thumbnail uploaded to Cloudinary.

→

3. Event saved in MongoDB
Event document stored with published: true/false and the image URL.

→

4. Events page displays it
GET /api/events returns only published events; the page shows them to visitors.

If saved as a Draft (published: false), the event stays visible only in the admin panel. There is no separate approval stage.
